

Basic structure:

<code>{{Template:Team:Teamname/filename.css}}</code>	import .css style file
<code>{{Template:Team:Teamname/filename}}</code>	import file (e.g. a template)
<code><html></code>	open html environment
<code><style></code>	open style environment
<code>:</code>	all style element declarations
<code></style></code>	close style environment
<code><head></code>	open head environment
<code><title>Title of Page</title></code>	define title
<code></head></code>	close head environment
<code><body></code>	open body environment
<code>:</code>	all body definitions
<code></body></code>	close body environment
<code></html></code>	close html environment

Style:

What you can alter:

(text-)align:	right, left, center, justify	orientation of text / objects:
border:	size in px	border of text / graphics / table
width:	size in px / % / auto	width of element
height:	size in px / % / auto	width of element

margin-top (/right / left / bottom): size in px
padding-bottom (/top / right / left): size in px

Text:

Write text:

<code><p>...</p></code>	environment for writing with paragraph
<code>
</code>	end-of-line

Text alignment:

css:

```
p{
    text-align:right;
}
```

style in html

```
<p align="right">...</p>    right-aligned
or
<p style="text-align:right;">...</p>    right-aligned
```

Text formatting:

heading:

```
<h1>...</h1>    heading in biggest size (try h2,...)
<h1 style="color:red">...</h1>    heading in biggest size colored red
```

special character:

ä	ä	Ä	Ä
ö	ö	Ö	Ö
ü	ü	Ü	Ü
ß	ß		
&	&		

attributes:

...	bold
<i>...</i>	italic
<u>...</u>	underlined
<strike>...</strike>	striked out
<small>...</small>	smaller text size
<big>...</big>	bigger text size
^{...}	superscript
_{...}	subscript

color:

<color="red">...</color>	define color red
<color="#00C0C0">...</color>	define color blue-green
...	colors words in red

Graphics:

Upload manager:

- <http://2014.igem.org/Special:Upload>
- Select file
- Type in destination filename
 - Teamname_YY-MM-DD_filename.jpg
- Optional: description in summary box
- Click: upload file
- View file in file list: <http://2014.igem.org/Special:ListFiles>
- Click on file
- Click on image
- Save link in extra document for further use

Include graphic in HTML

spacing:

hspace	spacing to lateral text
vspace	spacing to upper text

centering:

<center><img...></center>	center image
<img.... align="middle">	center image
	displays images next to each other (also possible: float:right)

Table:

Basic structure:

<code><table></code>	open table
<code><tr></code>	open line
<code><th>...</th><th>...</th></code>	open different cells for header (optional)
<code></tr></code>	close line
<code><tr></code>	open line
<code><td>...</td><td>...</td></code>	open different cells for input
<code></tr></code>	close line
<code></table></code>	close table

Attributes:

<code>border="1"</code>	thickness of border
<code>cellspacing="1"</code>	distance of grid cells to each other
<code>bgcolor="red"</code>	color of background
<code>bordercolor="red"</code>	color of table border
<code>width="70%"</code>	width relative to browser width
<code>align="right"</code>	orientation right

`colspan="2"`

combine cells next to actual cell

`rowspan="2"`

combine cells below to actual cell

Itemization:

Itemization: (unordered list)

<code></code>	open first level
<code>first line</code>	first line
<code>second line</code>	second line
<code></code>	open second level
<code>first line</code>	first element of second line
<code></code>	close second level
<code></code>	close first level

Enumeration: (ordered list)

<code>...</code>	numeric
<code><ol type="a">...</code>	enumeration with small letters
<code><ol type="A">...</code>	enumeration with capital letters
<code><ol type="i">...</code>	roman enumeration (small)
<code><ol type="I">...</code>	roman enumeration (big)

hint: you can nest `` and `` randomly.

Link:

external:

`Text of link`

anchor:

`<a name="picture..."`

set anchor

`<a href="#picture..."`

link to the anchor

attribute:

`...`

opens link in new tab

CSS:

Creation:

- Enter <http://2014.igem.org/Template:Team:Teamname/filename.css>
- Click "edit this page"

Basic structure:

`<html>`

open html environment

`<style type="text/css">`

open style css environment

`:`

define all css styles

`</style>`

close style css environment

`</html>`

close html environment

Class / ID:

- Class (#) has a higher value than ID (.)
- use ID for elements which occur once per page
- Select element for which you want to create attributes
- i.e:

```
#element{
    font-size: 5px;
    background-color: red;
    margin-left: 10px;
}
```
- Usage in HTML documents:

```
<p class="element">...</p>
```

 paragraph class element
or

```
<div class = element">...</div>
```

 element class element

Creation:

- Finish creation with "save page"
- Include .css file like on page 1

Set background image:

Define a css style:

```
body{
    background: black url("http://2014.igem.org/wiki/images/X/XX/Teamname\_YY-MM-DD\_background.png");
    background-size: 100% auto;
    background-position: center top;
    background-repeat: no-repeat;
    background-attachment: fixed;
}
```

link to background image
original size of background
position of the background
shows background only once
background does not scroll

Set button background:

Define a css style:

```
#button{
    background-image:url("http://2014.igem.org/wiki/images/2/29/Teamname\_YY-MM-DD\_button\_background.png");
    background-size: 100% 100%;
}
```

Use it in your body:

```
<body>
    <div id="button"><a href="...">Home</a></div>
</body>
if whole button should be clickable
<body>
    <a href="..."><div id="button">Home</div></a>
</body>
```

Set text font:

```
<p font-family="Arial">...</p>
<p font-size="12pt">...</p>
```

set text in font arial
set text in size 12pt
(in px also possible)

Helpful pages:

- <http://de.selfhtml.org/> anything for html code
- <http://meatballwiki.org/wiki/WikiMarkupStandard> anything for wiki code

Hints:

- Use show function of the wiki instead of saving each time
 - The show function do not always show the real apperance!
- First steps can be done in a .txt file
 - Open editor
 - Save file as "name.html" and select *Save as* "all types of files"
 - Open file in browser
- Create a style in .css for the text (.text{....}) and use <p class="text">....</p> in body

Code example:

css structure:

```
<html>
<style type="text/css">
.myText{
    text-align:center;
    margin-left:10px;
}
h1{
    text-align:left;
    padding-left:10px;
}
</style>
</html>
```

open html environment
open css type environment
start editing own style (with . or #)
altering text alignment
altering margin
end editing own style
start editing existing style
altering text alignment
altering padding
end editing own style
end css type environment
end html environment

using css:

class:

```
.css:
    .myText{
        font-size:12px;
    }
body:
    <p class="myText">...</p>
```

ID:

```
.css:
    #myText{
        font-size:12px;
    }
body:
    <p id="myText">...</p>
```

Code

```
<html>
<style>
</style>
<head>
  <title> This is HTML
</head>
<body>

</body>

</html>
```

Browser view

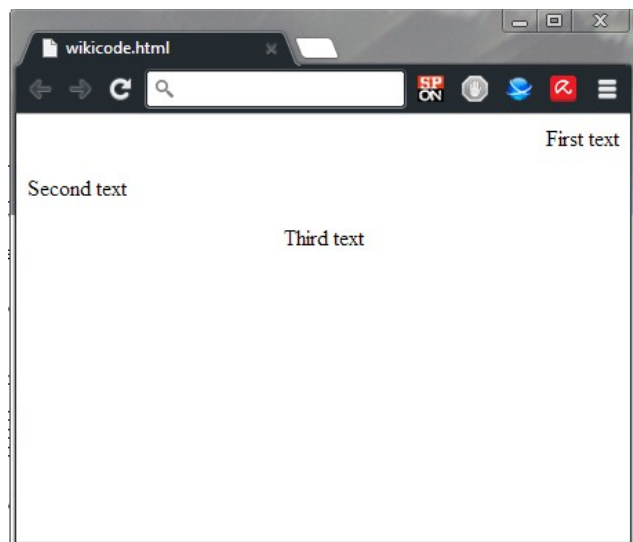

```
<html>
<style>
</style>

<body>
  <p align="right">First text</p>
  <p align="left">Second text</p>
  <p align="center">Third text</p>

</body>

</html>
```

Code

```
<html>
<style>

</style>
<body>
<h1>First heading</h1>
<h2 style="color:red">Second heading</h2>

</body>

</html>
```

Browser view

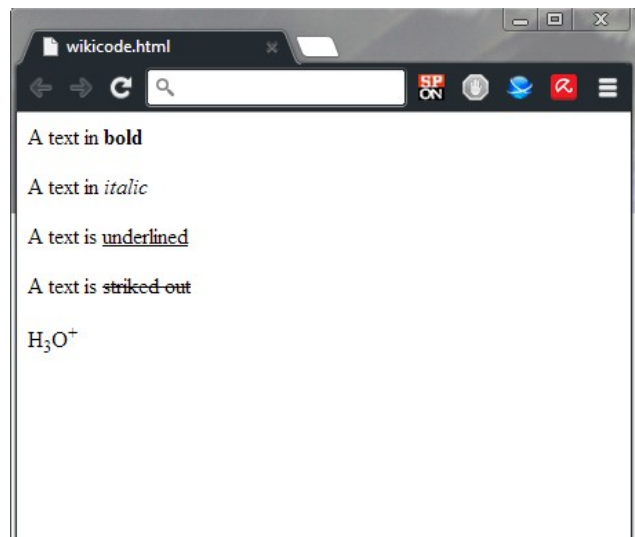

```
<html>
<style>

</style>

<body>
<p> A text in <b>bold</b></p>
<p> A text in <i>italic</i></p>
<p> A text is <u>underlined</u></p>
<p> A text is <strike>striked out</strike></p>
<p> H<sub>3</sub>O<sup>+</sup></p>

</body>

</html>
```

Code

```
<html>
<style>
p{
    color:red;
}
</style>

<body>
<p> This is a red text</p>
<p>Now <font color="blue">blue</font>!</p>
